Ecommerce-Project Assignment

We will be creating a project that allows users to browse items and add them to a shopping cart. You may use any theme you want. This project will be revisited several times (adding UI layer, advanced sorting methods) so pick something you're happy with. We will

Create a list of at least 20 items to sell

Filter what products are shown with button clicks (clicks added later!)

Allow users to add to a cart

Remove Items from cart

Provide users a total for their purchase

**Later*

All items shown and filtered on screen

Shopping cart with add/remove buttons and total order price

Group A Goals

Discount Codes: Create 3 possible discount codes, only one may be applied at checkout. Provide invalid code messages as well

Cart Functionality: Cart shows quantity of item so we do not see dupes (ex. Silver Watch X 2 rather than Silver Watch, Silver Watch

Stock: Each item has a stock amount, the user cannot add more than the amount the item has remaining in stock. Be sure to update this each time the user adds the item
